Dear Hiring Team,

I am writing to express my strong interest in the **AI Systems Engineer** role. My background centers on production AI systems, deterministic evaluation gates, and scalable microservices, guided by a core engineering thesis: AI proposes, deterministic code validates and gates, and nothing with a real external effect happens without hard verification.

In my recent work, I built an automated planner turning natural language requests into validated task trees grounded in codebases. A deterministic gate validates every plan, and a separate service without an LLM writes the updates. This separation gives the workflow a clear boundary between model-generated plans and changes to the tracker.

I also re-architected execution pipelines from synchronous HTTP blocking into an asynchronous queue-based job architecture with RabbitMQ and Redis, cutting latency to under 100 milliseconds with automated multi-provider failover.

I would welcome the chance to discuss how that experience relates to your team's engineering goals.

Thank you for your time,
Alex Vance
